

# HEMOSTASYL™

**1, 2, 3: blood-free! Reliable hemostasis in two minutes or less**

Quick, safe and pain-free: the new Hemostasyl from Pierre Rolland (Acteon Group) is a specially-composed chemical gel providing lasting hemostasis in the oral cavity within two minutes by way of an additional mechanical mode of action. In most cases, bleeding is even stopped within a few seconds by the hemostatic dressing - leaving a clean and dry working area to ease tartar removal and scaling.

The astringent and hemostatic effect of **Hemostasyl** arises from its special combination of aluminium chloride and kaolin. Hemostasis is further enhanced mechanically by the thixotropic properties of the material.

It takes only a few seconds to apply the turquoise-colored gel. The curved applicators make precise placement easier while preventing the risk of cross-contamination. The qualities of the gel adhere it to the mucous membrane even when there is moderate bleeding - without applying excessive pressure to the gums. After a maximum exposure of two minutes, the product can be removed with a gentle air/water spray accompanied by suction.

**Hemostasyl** is now available in a starter kit containing two syringes (2g each) and 40 disposable curved applicators. Refill packs are also available.

*Hemostasyl by Pierre Rolland (Acteon Group) is used for any case of moderate bleeding that may occur in daily practice (scaling, etc.). Its efficacy results from a combination of aluminum chloride and kaolin. The hemostatic effect is enhanced by its thixotropic properties.*
